EXAMINER SWARTHOUT, BRENT				
ART UNIT 2612		PAPER NUMBER		
NOTIFICATION DATE 04/23/2008		DELIVERY MODE ELECTRONIC		

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

creganoa@addmg.com

Office Action Summary

Application No.

10/649,267

Applicant(s)

FLICK, KENNETH E.

Examiner

Brent A. Swarthout

Art Unit

2612

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 4-1-08 Regard, Dec. on Req. for Rehear.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-41 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-6, 8-13, 15-22, 24-37 and 39-41 is/are rejected.
- 7) ☒ Claim(s) 7, 14, 23, 38 is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1,4,5,6,9,17,20-22,25-27,31-32,35-37 and 39-41 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hwang (407) in view of Zwern and Applicant's admitted Prior Art, Nykerk and Voss or Leen.

Hwang teaches a prealarm warning system comprising prealarm sensor (port b, Fig.1) for sensing low level security alert and prealarm emulator 102 for generating a signal on data communication line to alarm controller 103 to cause alert indicator 105 to generate a prealarm different than a full alarm (col.1, line 65- col.2, line 15), except for specifically stating that communications are carried out using a data bus "extending throughout the vehicle", or that components of the system are placed in a housing. It is noted that the term "extending throughout the vehicle" has support in the specification only to the extent that the bus is interconnected to various components that are throughout the vehicle, the specification being silent as to any specific physical location that the actual bus extends.

Zwern discloses an alarm system add on system wherein an alarm system is placed in housing 12 (Fig. 2).

Although Hwang does not specifically state that data communication line between emulator 102 and alarm controller 103 is a bus, use of such would have

Art Unit: 2612

been obvious to one of ordinary skill in the vehicle security communication art, since a bus is a well-known type of communication line in vehicle security communication systems.

Furthermore, Nykerk discloses an alarm system that issues a preliminary warning before sounding an alarm (Nykerk, col. 1, 11. 19-29; col. 2, 1.64 - col. 3, 1.2). To this end, a self-contained alarm system 55 (i.e., the "INVISIBEAM" system) detects the presence of an intruder in a zone of protection. In response to such detection, a preliminary warning vocally informs the user that a protected region has been entered (i.e., a pre-warning signal). The intruder is then given a predetermined time to move out of the protected area before sounding the alarm (i.e., alarm signal) (Nykerk, col. 3, 11.49-67; col. 6, 1.48 - col. 7, 1. 10). Also, the INVISIBEAM system can be used with other conventional alarm systems (Nykerk, col. 7, 11.32-63).

The alarm system 55 is connected to a control unit which is, in turn, connected to a wire harness 30 (Nykerk, Fig. 1; col. 8, 11. 14-17; col. 9, 11. 59-63). The alarm system 55 is also connected to the wire harness via interface/driver 88 (Nykerk, col. 11, 11.53-62; Fig. 4). Significantly, the wire harness 30 extends substantially the entire length of the vehicle with various components (e.g., headlights, taillights, horn, sensors, etc.) connected thereto as shown in Figure 1 (Nykerk, Fig. 1; col. 7, 1. 64 - col. 8, 1.23).

It is noted that since appellant's claims do not provide specific limitations regarding the physical extent of the term "throughout the vehicle", the data bus in Nykerk satisfying the broad limitation of a data bus extending throughout a vehicle.

Furthermore, since Nykerk teaches that data bus 64 via interface 88 and electrical harness 30 communicates with vehicle components, this essentially makes the harness 30 part of the communications bus.

Appellant indicates in the Specification that vehicle manufacturers have attempted to reduce the amount of wiring within vehicles to reduce weight, wiring problems, decrease costs, and reduce complications which may arise during troubleshooting. To this end, manufacturers have adopted multiplexing schemes to reduce cables to three or four wires and simplify the exchange of data among various onboard electronic systems.

Voss also documents similar efforts. See, e.g., Voss, at 1 (noting that in-vehicle data bus (IVDB) technology met design goal of 20% wiring harness reduction); that "Multiplex technology should decrease the number of connections and reduce wire harness variants."; and that "Wiring harness reduction and simplification of sub-system installation are main targets of multiplex and data bus technology.".

In fact, since the early 1980s, centralized and distributed networks have replaced point-to-point wiring. See Leen, at 88; see also ("[I]n a 1998 press release, Motorola reported that replacing wiring harnesses with LANs in the four doors of a BMW reduced the weight by 15 kilograms while enhancing functionality."). Moreover, Leen notes that one of the first and most enduring automotive control networks, the "controller area network" (CAN), was developed in the mid-1980s.

In view of the clear trend in the industry for replacing wiring harnesses with data communications buses in vehicles as evidenced above, it would have been obvious to the skilled artisan at the time of the invention to replace the wiring harness 30 in Nykerk that extends throughout the vehicle with a data communications bus carrying data and address information thereover to, among other things, reduce weight, cost, and complexity by precluding the need for dedicated, point-to-point wiring for communicating with the various vehicle electrical components.

In this regard, one having ordinary skill, facing the wide range of needs created by developments in the vehicular manufacturing industry (e.g., the increased demand for electronic devices in vehicles while at the same time reducing cost and complexity), would have seen a benefit to upgrading the wire harness 30 with a data communications bus. Moreover, the effects of demands known to the design community (i.e., reducing vehicle weight while accommodating increased demand for on-board electronic devices), along with the prior art teachings noted above and the background knowledge of the skilled artisan (an electrical engineer with several years of related

industry experience), would have reasonably motivated the skilled artisan to utilize a data communications bus as a suitable replacement for a wire harness.

It would have been obvious to connect a prealarm warning system as disclosed by Hwang and provide a housing as suggested by Zwern, to communicate signals over a vehicle data bus as suggested by Nykerk, Admitted Prior Art and Voss or Leen, in order to take advantage of wiring already existing in a vehicle without having to add supplemental wiring to communicate sensed data in a vehicle alarm system, and to allow communication with specific vehicle systems which have individual addresses (col.5, line 17), and to provide protection for sensitive system components from environmental and mechanical elements.

One of ordinary skill in the art would have found it obvious to use the data bus systems extending throughout the vehicle as disclosed by Nykerk , Admitted Prior Art and Voss or Leen to communicate with a prealarm device as disclosed by Hwang in a vehicle that was already equipped with wiring harnesses to vehicle components, while recognizing the advantages of using a data bus system in conjunction with a prealarm system, in order to allow addressing of individual components to enable bi-directional communication and to save on wiring costs by not having to use harnesses where a data bus already existed.

Regarding claim 4, Hwang teaches use of sensor b for detecting high security alarm conditions (col.2, lines 5-15).

Regarding claims 5-6, Zwern discloses desirability of indicating confirmation of switching between alarm armed and disarmed modes by

LED indications 56,58. Since alarms will only be generated when in armed mode, some type of communication signal over communication lines would have been inherent in order to control operation of the system.

Regarding claim 9, Hwang teaches use of siren 105.

Regarding claim 39, Zwern teaches desirability of using both shock and motion sensors in a vehicle security system (col. 9, lines 50-52).

Regarding claim 41, Zwern teaches indicator carried on housing (Fig. 2).

2. Claims 1,4,5,6,9,17,20-22,25-27,31-32,35-37 and 39-41 are rejected under 35 USC 103(a) as being unpatentable over Hwang (407) in view of Zwern, Nykerk and Boreham et al.

Hwang teaches a prealarm warning system comprising prealarm sensor (port b, Fig.1) for sensing low level security alert and prealarm emulator 102 for generating a signal on data communication line to alarm controller 103 to cause alert indicator 105 to generate a prealarm different than a full alarm (col.1, line 65- col.2, line 15), except for specifically stating that communications are carried out using a data bus "extending throughout the vehicle", or that components of the system are placed in a housing. It is noted that the term "extending throughout the vehicle" has support in the specification only to the extent that the bus is interconnected to various components that are throughout the vehicle, the specification being silent as to any specific physical location that the actual bus extends.

Art Unit: 2612

Zwern discloses an alarm system add on system wherein an alarm system is placed in housing 12 (Fig. 2).

Although Hwang does not specifically state that data communication line between emulator 102 and alarm controller 103 is a bus, use of such would have been obvious to one of ordinary skill in the vehicle security communication art, since a bus is a well-known type of communication line in vehicle security communication systems.

Furthermore, Nykerk discloses an alarm system that issues a preliminary warning before sounding an alarm (Nykerk, col. 1, 11. 19-29; col. 2, 1.64 - col. 3, 1.2). To this end, a self-contained alarm system 55 (i.e., the "INVISIBEAM" system) detects the presence of an intruder in a zone of protection. In response to such detection, a preliminary warning vocally informs the user that a protected region has been entered (i.e., a pre-warning signal). The intruder is then given a predetermined time to move out of the protected area before sounding the alarm (i.e., alarm signal) (Nykerk, col. 3, 11.49-67; col. 6, 1.48 - col. 7, 1. 10). Also, the INVISIBEAM system can be used with other conventional alarm systems (Nykerk, col. 7, 11.32-63).

The alarm system 55 is connected to a control unit which is, in turn, connected to a wire harness 30 (Nykerk, Fig. 1; col. 8, 11. 14-17; col. 9, 11. 59-63). The alarm system 55 is also connected to the wire harness via interface/driver 88 (Nykerk, col. 11, 11.53-62; Fig. 4). Significantly, the wire harness 30 extends substantially the entire length of the vehicle with various components (e.g., headlights, taillights, horn, sensors, etc.) connected thereto as shown in Figure 1 (Nykerk, Fig. 1; col. 7, 1. 64 - col. 8, 1.23).

It is noted that since appellant's claims do not provide specific limitations regarding the physical extent of the term "throughout the vehicle", the data bus in Nykerk satisfying the broad limitation of a data bus extending throughout a vehicle.

Furthermore, since Nykerk teaches that data bus 64 via interface 88 and electrical harness 30 communicates with vehicle components, this essentially makes the harness 30 part of the communications bus.

Boreham discloses a siren unit 2 with a CPU 4 that provides signals that activate an audible siren responsive to trigger signals received on control input 10 via serial interface 12. The control input 10 is connected to a vehicle security control unit that is able to (1) monitor the vehicle, (2) determine when an alarm condition occurs, and (3) issue the appropriate trigger signal (Boreham, col. 2, 11.41-53; Fig. 1).

Depending on the siren unit's configuration, the siren unit is triggered in either of two ways: (1) the contents of a control data packet received by the serial interface 12, or (2) a trigger signal on the control input 10 (Boreham, col. 4, 11.28-31). If serial interface control is enabled, the CPU must regularly receive (e.g., every second) a 24-bit control packet 54 from the vehicle security control unit to prevent the siren from being activated (Boreham, col. 4, 1.55 - col. 5, 1. 12).

The details of this 24-bit control packet are provided in the table in column 5 and Figure 6. Significantly, a four-bit address field is provided (Bits 0-3) which enables the vehicle security control unit to address devices other than the siren unit 2 on a single serial data bus (Boreham, col. 5, 11. 15-60; col. 6, 11.20-23; Fig. 6).

Although the exact extent of this serial data bus is unclear from the reference, Boreham nevertheless provides some indication of the ability of the vehicle security control unit to communicate with vehicle devices other than the siren unit. The vehicle security control unit can generate a warning signal by causing an LED on the instrument panel to flash (Boreham, col. 7, 11. 14-23). Moreover, in an alternative embodiment shown in Figure 8, the vehicle security control unit can monitor the state of the ignition line 28 and

Art Unit: 2612

report its status to the siren unit's CPU via the control packet (Boreham, col. 7, 11.52-56; Fig. 8).

Boreham does not expressly state that the vehicle security control unit communicates with the vehicle's instrument panel and ignition line via the serial data bus. Nevertheless, the collective teachings of Boreham strongly suggest that this is the case given the stated ability to address multiple devices using the bus, or, at the very least, a viable alternative to point-to-point wiring.

In any event, the fact that four data bits are provided in the control packet for addressing various vehicle devices suggests that 16 different devices can be addressed. The skilled artisan would have reasonably inferred that addressing 16 different devices on a vehicle on a single serial bus would reasonably involve extending the bus throughout the vehicle to facilitate such communication. Even assuming that these 16 devices could be within the same general vicinity in the vehicle, the clear import of Boreham is that such devices could likewise be installed at various locations throughout the vehicle, particularly in view of Boreham's specific references to communicating with the instrument panel and the ignition line.

In short, nothing precludes extending the serial data bus throughout the vehicle to facilitate data communication with various vehicle devices using the bus.

In any event, Nykerk teaches extending a wire harness 30 substantially the entire length of the vehicle with various components (e.g., headlights, taillights, horn, sensors, etc.) connected thereto as shown in Figure 1 (Nykerk, Fig. 1; col. 7, 1.64 - col. 8, 1. 23). In view of this, since there are four bits in the Address Field, 24 (or 16) unique addresses can be accommodated in this field. In view of this

teaching, the skilled artisan would have ample reason to extend the data bus in Boreham to facilitate communication with electrical devices located at the front and rear of the vehicle.

It would have been obvious to use a bus throughout a vehicle alarm system as discussed above in conjunction with a vehicle alarm system including a pre-alarm system as suggested by Hwang, in order to allow spurious alarms to only temporarily sound avoiding nuisance alarms, or to allow attention to be drawn to a vehicle before a vehicle was stolen, while still taking advantage of the desirable characteristics of a bus connection system, such as more compact connections and lower weight.

3. Claims 2,10,12,13,16,18,28 and 33 are rejected under 35 U.S.C.

103(a) as being unpatentable over Hwang (407) in view of Zwern and Applicant's admitted Prior Art, Nykerk and Voss or Leen and further in view of Hwang (697).

Hwang (697) discloses desirability of making a pre-warn alert shorter than a high level alert (col.2, lines 29-38).

It would have been obvious to use a short pre-warn alert in conjunction with a system as disclosed by Hwang (407), Zwern, Admitted prior art, Nykerk and Voss or Leen in order to notify parties that a vehicle was alarmed while still minimizing nuisance alerts of long duration.

4. Claims 2,10,12,13,16,18,28 and 33 are rejected under 35

USC 103(a) as being unpatentable over Hwang (407) in view of Zwern, Nykerk and Boreham et al. and further in view of Hwang (697).

Hwang (697) discloses desirability of making a pre-warn alert shorter than a high level alert (col.2, lines 29-38).

It would have been obvious to use a short pre-warn alert in conjunction with a system as disclosed by Hwang (407), Zwern, Nykerk and Boreham in order to notify parties that a vehicle was alarmed while still minimizing nuisance alerts of long duration.

5. Claims 3,8,19,24,29,30 and 34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hwang (407) in view of Zwern and Applicant's admitted Prior Art, Nykerk and Voss or Leen and further in view of Issa et al.

Issa teaches desirability of using pre-warn alerts of lesser intensity than alarms for high levels of concern (col.3, lines 19-35,65-67).

It would have been obvious to use a lower volume alert for less hazardous conditions as suggested by Issa in conjunction with an alarm system as disclosed by Hwang (407), Zwern, and Admitted prior art, Nykerk and Voss or Leen, in order to let a bystander know how serious an alert condition was.

Regarding claim 8, Issa teaches use of a two zone shock sensor, one zone for light touches and a second zone for heavy impacts (col.3, lines 20-25, 65-67).

6. Claims 3,8,19,24,29,30 and 34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hwang (407) in view of Zwern, Nykerk and Boreham et al. and further in view of Issa et al.

Issa teaches desirability of using pre-warn alerts of lesser intensity than alarms for high levels of concern (col.3, lines 19-35,65-67).

It would have been obvious to use a lower volume alert for less hazardous conditions as suggested by Issa in conjunction with an alarm system as disclosed by Hwang (407), Zwern, Nykerk and Boreham, in order to let a bystander know how serious an alert condition was.

Regarding claim 8, Issa teaches use of a two zone shock sensor, one zone for light touches and a second zone for heavy impacts (col.3, lines 20-25, 65-67).

7. Claims 11 and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hwang (407) in view of Zwern and Applicant's admitted Prior Art, Nykerk and Voss or Leen and further in view of Hwang (697) and Issa et al.

Claims are rejected for the same reasons as set forth previously with regard to claims 1-3.

8. Claims 11 and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hwang (407) in view of Zwern, Nykerk and Boreham et al. and further in view of Hwang (697) and Issa et al.

Claims are rejected for the same reasons as set forth previously with regard to claims 1-3.

9. Claims 7,14,23 and 38 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

10. If applicant chooses to incorporate limitations of objected to claims into independent claims, appropriate Terminal Disclaimers should be on file associated with any other co-pending applications or patents that claim same allowable subject matter

as the objected to claims, and applicant is reminded of the duty of disclosure to bring to the attention of the Patent Office any claimed subject matter in copending applications that includes like subject matter to that in the objected to claims.

11. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Brent A. Swarthout whose telephone number is 571-272-2979. The examiner can normally be reached on M-Th from 6:00 to 3:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Daniel Wu, can be reached on 571-272-2964. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
